

Case Study: Payment link generation workflow

Background

Dealerships currently lack the ability to generate shareable payment links for customers directly within their management system. This creates friction in the payment collection process. Tekion aims to bridge this gap by integrating with a payment link generation service through an orchestration layer.

Objective

Configure an integration workflow that receives payment request data from Tekion, generates a payment link via an external API, and updates the payment record in the system.

You may use any automation platform and AI tools of your choice (e.g., n8n, Zapier, Make, Pipedream, custom code, etc.).

Scope

Build a workflow that:

1. Receives payment request data from Tekion (customer info, amount, invoice number)
2. Calls the Payment Link API to generate a payment link
3. Extracts response fields (payment_link, ID, referenceId)
4. Updates the payment record via the Update API
5. Implements error handling for all failure scenarios

1. Data sent from Tekion Application

```
{  
  "contactId": "CONT_10001",  
  "customerName": "Amit Sharma",  
  "customerPhone": "+919876543210",  
  "customerEmail": "amit.sharma@example.com",  
  "invoiceNumber": "INV_10234",  
  "paymentAmount": 1000,  
  "currency": "INR",  
  "referenceId": "TS1989",  
  "description": "Payment for service order INV_10234"  
}
```

Payment Link API

Request

```
curl --location 'https://mp546cd608b430b4bd1c.free.beeceptor.com' \  
--header 'token: 122334' \  
--header 'Content-Type: application/json' \  
--data-raw '{  
  "amount": 1000,  
  "currency": "INR",  
  "expire_by": 1691097057,  
  "referenceId": "TS1989",  
  "description": "Payment for service order INV_111111",  
  "customer": {  
    "name": "Amit Sharma",  
    "contact": "+919876543210",  
    "email": "amit.sharma@example.com"  
  },  
  "notify": {  
    "email": true  
  },  
  "reminder_enable": true,  
  "notes": {  
    "key_name": "key_value"  
  }  
}'
```

Response:

```
{  
  "status": "Payment link updated",  
  "ID": "123456",  
  "data": {  
    "payment_link": "https://api.xyz.com/v1/payment_links/123456",  
    "ID": "123456",  
    "referenceId": "TS1989"  
  }  
}
```

Update the Contact API

Request:

```
curl --location --request GET 'https://update-payment-details.free.beeceptor.com' \  
--header 'token: 12345' \  
--header 'Content-Type: application/json' \  
--data '{  
  "payment_link": "https://api.xyz.com/v1/payment_links/123456",
```

```
"ID": "123456",  
"referenceId": "TS1989"  
}'
```

Sample response:

```
{  
  "status": "Payment link updated",  
  "ID": "123456",  
  "data": {  
    "payment_link": "https://api.xyz.com/v1/payment_links/123456",  
    "ID": "123456",  
    "referenceId": "TS1989"  
  }  
}
```

Technical Guidelines

- Feel free to choose your preferred workflow automation platform.
- The solution should be modular, maintainable, and scalable.
- Document any assumptions and design decisions.

Deliverables

Please submit the following:

1. Workflow designs and explanation of same along with assumptions made.
2. Workflow export or source code.
3. Setup and execution instructions.
4. A short demo video explaining the workflow.

Note:

1. Please feel free to make reasonable assumptions where requirements are not explicitly defined and document those assumptions in your submission.
2. The provided API is a mock implementation and may not be consistently available. Design your workflow to work with the specified request and response format.
